TraffickAid Mobile Application Wireframe Design and Iteration

Creating low-fidelity wireframes is an essential part of the UI/UX design process because it allows designers to focus on structure, layout, and user interaction before worrying about visual design. For this assignment, I selected my own mobile application, **TraffickAid**, which is designed to support human trafficking survivors, provide educational resources, and allow users to anonymously report suspicious activity. The purpose of this project is to design wireframes for a key user workflow, improve the design through iteration, and explain how these changes enhance usability. The workflow I selected is submitting an anonymous report, as it is one of the most important and sensitive features of the application.

Primary User Workflow

The main workflow demonstrated in this design is:

User submits an anonymous human trafficking report

This workflow is critical because users may be in urgent or sensitive situations where they need to share information quickly and safely. The steps include:

1. User opens the app (entry point)
2. User navigates to the dashboard
3. User selects the “Report” feature
4. User fills out and submits an anonymous report
5. User receives confirmation

This workflow focuses on simplicity, privacy, and ease of use.

Wireframe Explanation and Annotations

The wireframe for the **TraffickAid** application illustrates the primary workflow of submitting an anonymous human trafficking report. The design includes five key screens that guide the user from entry to completion in a clear and structured way. The **entry point (login screen)** allows users to securely access the application by entering their credentials. This ensures that users can safely interact with the platform while maintaining privacy. The **dashboard screen (home screen)** acts as the main navigation hub. It includes key features such as crisis support, reporting, resources, and donation options. The layout is designed with large, simple buttons to improve accessibility and reduce cognitive load, especially for users who may be in stressful situations. The **report screen** represents the core functionality of the application. It allows users to submit information about suspected human trafficking activity. The form includes optional fields such as location, description, and media upload, as well as an option to remain anonymous. This design ensures that users feel safe and are not overwhelmed when providing information. The confirmation screen gives feedback after submission. This step is important because it reassures the user that their report has been successfully received and handled securely. Providing confirmation improves trust and reduces uncertainty. The **revised dashboard screen** introduces a **Quick Report feature**, which allows users to submit a report directly from the home screen without navigating through multiple steps. This improvement is especially important in urgent or high-risk situations.

Wireframe for TraffickAid

Mobile

WORKFLOW/INTERACTION FLOW

Below are attached screenshots individually for a better and clear picture.

1. ENTRY POINT (LOGIN SCREEN)

The image shows a mobile app login screen for 'TraffickAid'. At the top left is a hamburger menu icon. Next to it is the TraffickAid logo, which features a heart shape with a person inside, set against a blue and purple background. Below the logo, the text 'Welcome to TraffickAid' is displayed in a large, blue, serif font. Underneath this, the text 'Sign in to continue' is shown in a smaller, grey font. A horizontal line with the word 'OR' in the center separates the sign-in section from the registration section. Below this line, the word 'EMAIL' is displayed in a grey font. Underneath 'EMAIL' is a text input field containing the email address 'hello@reallygreatsite.com'. Below the email field is the word 'PASSWORD' in a grey font, followed by a password input field with six dots. Below the password field is a blue button with the text 'Sign in' in white. Below the 'Sign in' button is the text 'DATE OF BIRTH' in a grey font, followed by a date input field. At the bottom of the screen, there is a grey button with the text 'Forgot password?' and 'Need an account? Sign up' in a smaller font. An arrow points from the right side of the app screen towards the right edge of the image.

ANNOTATIONS

- User enters credentials to access the app
- "Sign In" button navigates to Dashboard

2. DASHBOARD (HOME SCREEN)

ANNOTATIONS

- Main navigation hub
- User selects "Report"
- "Something" - goes to Report Screen

3. REPORT SCREEN (ANONYMOUS REPORT)

Anonymous Reporting

Your privacy is protected

Location

Enter location

Description

Describe what happened

Date of incident

Upload

Add photo/video or audio recording

Need to Talk to Someone?

Live Chat

Submit Report

ANNOTATIONS

- User provides details (all fields optional)
- Toggle ensures anonymity
- "Submit Report" → sends report securely

4. CONFIRMATION SCREEN (REPORT SUBMITTED)

ANNOTATIONS

- Provides confirmation and reassurance
- 'Return to Home' navigates back to Dashboard

5. REVISED DASHBOARD (WITH
QUICK REPORT FEATURE)

ANNOTATIONS

- New "Quick Report" shortcut reduces steps
- Users can report immediately from the Dashboard
- Improves speed and usability

Design Improvement and Usability Impact

The addition of the Quick Report feature significantly improves the usability of the application. In the original workflow, users needed to navigate through multiple steps to access the reporting form. However, in real-world scenarios, users may need to act quickly and discreetly.

By reducing the number of steps required, the improved design:

- Increases efficiency
- Enhances accessibility for users under stress
- Provides faster navigation and better user control
- Supports urgent reporting situations

This change aligns with user-centered design principles by prioritizing speed, simplicity, and safety.

Annotation of Interactions

Each wireframe includes clear interaction indicators such as:

- Buttons → navigate to next screen
- Submit → sends report
- Confirmation → provides feedback

These annotations help explain how users move through the system and ensure the design is easy to understand.

Iteration and Continuous Improvement

The process of iteration plays a critical role in improving user experience. The initial wireframe focused on organizing the structure and workflow, while the revised version introduced enhancements based on usability considerations. Through iteration, designers can identify pain points, test improvements, and refine the interface to better meet user needs. In the case of TraffickAid, the addition of the Quick Report feature and confirmation screen demonstrates how small design changes can have a significant impact on usability and effectiveness.

Conclusion

This assignment showed how wireframing can be used to design and improve a mobile application. By focusing on the anonymous reporting workflow in TraffickAid, I created a clear and functional set of wireframes that prioritize user safety, simplicity, and accessibility. The addition of the Quick report feature shows how small design changes can significantly improve

usability. This process highlights the importance of thoughtful design and continuous iteration in creating meaningful and effective user experiences.
