Prototyping User Interactions

Creating an interactive prototype is one of the most important steps in the user experience design process because it allows designers to turn ideas into something visual and functional before development begins. Instead of only describing how an application should work, prototypes allow designers, developers, and stakeholders to see how users will move through the interface and interact with unique features. This process helps identify usability problems early and improves the overall quality of the final application. According to Garofalo (2025), standardized design systems and interactive prototyping improve consistency, usability, and communication during the software design process.

For this assignment, I created a high-fidelity interactive prototype for a fitness company's mobile application using Figma and Material Design 3 components. The goal of the prototype was to demonstrate how users would browse available fitness classes, view details about a selected class, and complete the booking process. The application was designed as a mobile experience because fitness users often need quick and convenient access to class information while on the go. While designing this prototype, I focused on creating an interface that was simple, visually organized, and easy to navigate. I wanted users to feel comfortable moving from one screen to another without confusion. The design uses consistent colors, layouts, buttons, and typography across all screens to create a cohesive user experience. I also considered usability principles such as readability, spacing, accessibility, and intuitive navigation patterns.

The final prototype includes three connected screens that simulate a realistic booking workflow. These screens demonstrate how users interact with the application step by step and how design standards can improve both functionality and visual consistency.

Interactive Prototype

The interactive prototype includes three connected mobile screens that simulate the complete fitness class booking workflow. The first screen allows users to browse available fitness classes, the second screen displays detailed information about a selected class, and the third screen confirms that the booking has been completed successfully.

The prototype was created in Figma using phone-sized frames and interactive links between screens. Each screen was connected using prototype interactions so the user could move naturally through the application. The workflow begins when the user selects a class from the list of available fitness sessions. The user is then taken to the class details screen where they can review information such as the instructor, duration, difficulty level, and available spots. After selecting the “Book This Class” button, the user is directed to the booking confirmation screen.

The prototype shows realistic navigation behavior like what users would experience in a mobile application. The use of transitions and connected screens improves the overall realism of the prototype and allows the design to be evaluated before development begins.

Screens Designed Using Standardized UI Components

The prototype screens were designed using standardized Material Design 3 components to ensure consistency across the interface. Material Design provides a professional design system that

includes reusable UI elements such as app bars, buttons, cards, icons, typography, and layouts (Garofalo, 2025). Using standardized components improves usability because users are already familiar with common design patterns used in modern mobile applications.

Screen 1: Available Classes

The first screen is titled “Fitness Classes” and displays four available fitness sessions using horizontal cards stacked vertically. Each card contains the class name, class time, instructor name, and number of spots remaining. The screen also includes a top app bar that provides structure and consistency.

The cards were designed using consistent spacing, typography, and alignment to make the information easy to scan quickly. One of the class cards is interactive and links directly to the second screen.

Screen 2: Class Details

The second screen provides detailed information about the selected fitness class. The app bar includes a back arrow, so users can return to the previous screen. A hero image was added to improve visual engagement and create a more modern mobile app appearance.

The screen also contains detailed information about the class including:

- Class name
- Time and duration
- Instructor biography
- Difficulty level
- Remaining spots

A filled Material Design button labeled “Book This Class” allows the user to continue the workflow.

The layout uses proper spacing and typography hierarchy to ensure readability and visual organization. Standardized Material Design text styles and buttons create consistency with the first screen.

About this class

A gentle and energizing flow that connects breath with movement. This class is designed to improve flexibility, balance, and focus while reducing stress and tension.

Book This Class

Screen 3: Booking Confirmation

The final screen confirms the successful booking of the fitness class. This screen includes a success checkmark icon, confirmation message, booking summary card, and two buttons labeled “View My Schedule” and “Add to Calendar.”

The confirmation message provides positive feedback to the user and reassures them that the booking process was completed successfully. The booking summary displays vital information including the class name, instructor, date and time, and location.

The “View My Schedule” button links users back to the main classes screen to continue browsing or managing classes.

Interactive Connections Between Screens

Interactive connections were added between the screens in Figma to simulate realistic user movement through the application. These interactions allow users to complete the booking workflow from beginning to end.

The workflow begins on the “Fitness Classes” screen where the user selects a class card. This interaction links directly to the “Class Details” screen. On the details screen, the back arrow returns users to the main classes page while the “Book This Class” button navigates to the booking confirmation screen.

On the confirmation screen, the “View My Schedule” button returns the user to the first screen to simulate continuing interaction within the app. These interactions demonstrate how users would naturally navigate through the application and complete their booking tasks.

The connected prototype creates a realistic user experience because the screens behave similarly to a functional mobile application. Adding interactions also makes it easier to test usability and identify potential navigation problems before development.

Evaluation of Usability, Consistency, and Visual Coherence

The prototype was evaluated based on usability, consistency, and overall visual coherence. One of the most important usability considerations was making the booking workflow simple and

intuitive. Users can move through the screens using familiar navigation patterns, including buttons and back arrows commonly used in mobile applications.

Consistency was maintained by using the same typography styles, spacing, button designs, and color themes across all three screens. The use of Material Design 3 components ensured that every screen followed standardized design principles and maintained a cohesive visual identity.

Visual coherence was also improved through organized layouts, consistent alignment, and balanced spacing between elements. Information was grouped logically so users could easily understand the content without feeling overwhelmed. The use of cards, icons, and buttons helped organize information clearly and improve readability.

Accessibility and readability were also considered throughout the design process. Text sizes were large enough to read comfortably on mobile devices, and buttons were designed with sufficient spacing to improve touch interaction. The design avoids clutter and focuses on creating a clean and modern appearance.

User Flows and Integration of Design Standards

The prototype demonstrates a complete user flow for booking a fitness class. The workflow begins when users browse available classes, continues when they review detailed information about a selected class, and ends when they receive confirmation of their booking.

This flow reflects a realistic mobile application experience because users are guided step by step through the booking process. Each screen has a clear purpose and supports the user's goal of successfully reserving a fitness class.

Design standards were integrated effectively throughout the prototype using Material Design 3 components and layout principles. Standardized UI elements improve consistency, usability, and familiarity for users. The design also follows common mobile application patterns including app bars, cards, hero images, buttons, and confirmation messages.

Using established design standards is important because it improves efficiency during development and creates interfaces that users can understand quickly (Garofalo, 2025).

Consistent design patterns reduce confusion and create a more professional and reliable user experience.

Conclusion

This assignment provided valuable experience in designing a realistic and interactive mobile application prototype using Figma. Creating the three connected screens helped demonstrate how interactive prototyping supports the overall software design process before development begins. Instead of only imagining how the application would function, the prototype made it possible to visually test user interactions, navigation, and workflow behavior. One of the most important lessons from this assignment was understanding the importance of usability and consistency in interface design. Small details such as spacing, typography, button placement, and navigation patterns play a key role in how users experience an application. By using Material Design 3 components, I was able to create a more professional and visually cohesive interface that follows modern mobile application standards. The prototype successfully demonstrates the complete booking process for a fitness class application. Users can browse classes, review detailed information, and confirm their booking in a clear and organized way. The interactive connections between screens also help simulate how users would naturally move through the application in a

real-world environment. Overall, this assignment strengthened my understanding of user experience design, interactive prototyping, and design consistency. It also demonstrated how standardized UI components and user-centered design principles help create interfaces that are easier to use, visually appealing, and more efficient for users. These skills are extremely important in professional software development because they help ensure applications meet user needs while maintaining functionality and accessibility.
